

Bug summary:

App crashes when clicking

Observed Behavior (a description of what happened with the app):

I open the app and I add a new weight record of 20KG. I then add a comment to the new weight record. I then long click the record and click "add the previous comment". The app then crashes instead of performing the action.

Expected Behavior (a description of what you expected to happen):

When I click "add previous comment" to the previous entry, the app should add the comment and should not crash.

Steps to Reproduce (the steps to reproduce the problem):

1. click weight
 2. enter in a weight
 3. click go
 4. click set current weight in kg
 5. click on the new entry
 6. enter a test comment
 7. long click on entry
 8. click add previous comment
 9. app crashes
-

Additional information:

I have included an image of the crash page.
