Bug summary:

"DroidWeight has stopped open app again" error (app crashes)

Observed Behavior (a description of what happened with the app):

I opened DroidWeight and went to statistics, hit BMI, entered 50 for height and 60 for weight and the app crashed.

Expected Behavior (a description of what you expected to happen):

I expected the app to calculate a BMI index for me or specify that my input was weird (I kind of put bad numbers and I'm not sure what the units were) but it just crashed instead.

Steps to Reproduce (the steps to reproduce the problem):

1. Launch app

2. Tap statistics from the menu up top

3. Hit "BMI"

4. Enter "50" for height

5. Enter "60" for weight

6. Hit "Go"

7. App should now crash
