Bug summary:

App crashes if delete the created token

Observed Behavior (a description of what happened with the app):

Application crashes

Expected Behavior (a description of what you expected to happen):

The token can be deleted without any error or crash.

Steps to Reproduce (the steps to reproduce the problem):

1. Click the app icon to start Android Token

2. Click "Action overflow" button (Three dots on the right-top corner)

3. Select "Add Token". Then, choose Token Type as "Event Token"

4. Type name as "test", leave "Serial No" as empty, and update "OTP Length" to 6. Then, click the "NEXT" button

5. Select "Generate Random Seed" for Token Seed Method, and update to "Base 32". Finally, click the "COMPLETE" button.

6. Now, you can see a token named "test" has been created. Once we've reached this point, click the "Action overflow" button on the right-top corner again, and click "Delete Token"

7. Select the created "test" token, and click the "OK" button.

8. The app will crash at this point.

Additional information:

This bug should be assigned the highest priority to be fixed as the app crashes.
