Bug summary:

Attempting to duplicate a plant makes the tracker crash.

Observed Behavior (a description of what happened with the app):

The behavior leading up to duplicating the plant is as expected and works without issues. When I press the duplicate button, a popup appears with the message "Tracker has stopped" and I'm given the option to re-open the app. When I reopen the app the plant that I created is still there, but there is no duplicate as requested.

Expected Behavior (a description of what you expected to happen):

Instead of crashing, I expect the app to create an identical copy of the plant that a user selects; with the same details, dates, information, and images. I also expect the app to do this without crashing or requiring a restart.

Steps to Reproduce (the steps to reproduce the problem):

1. On the main menu, click the red + button on the bottom right.

2. Add relevant plant information and select the tick button on the top left of the screen

3. click on your newly created plant. After clicking to the plant, click on the menu button on the right of the "Plant Details" header.

4. Select the duplicate button from the menu that appears

5. At this point, an error message prompting the user to re-open the app should appear, and the app crashes in the background
